

CVIT Day 4 Homework Morning Session (Panorama)

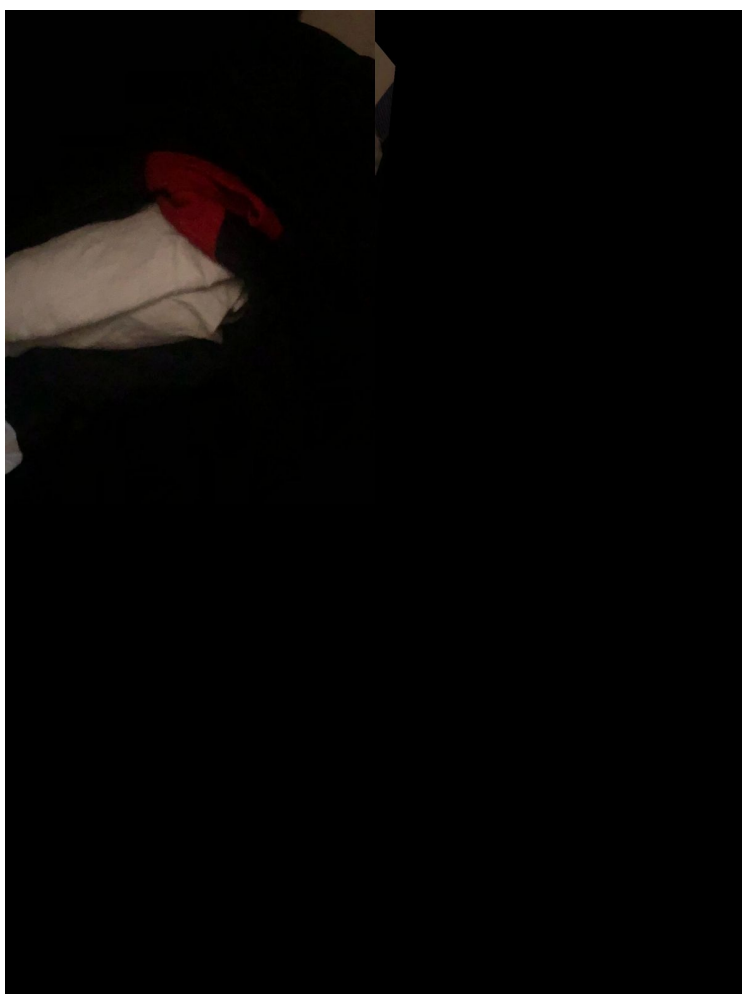

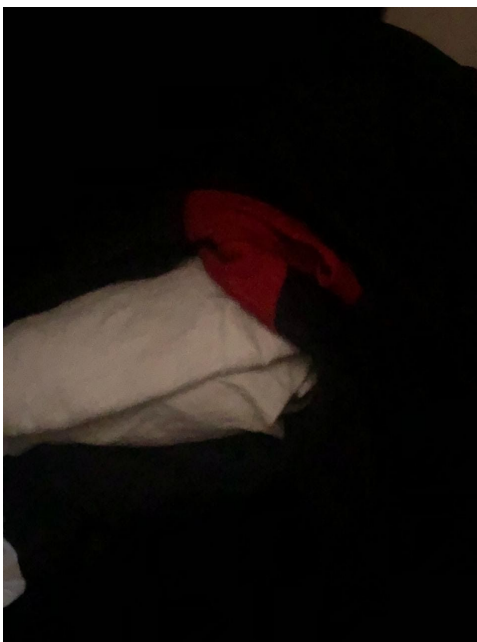

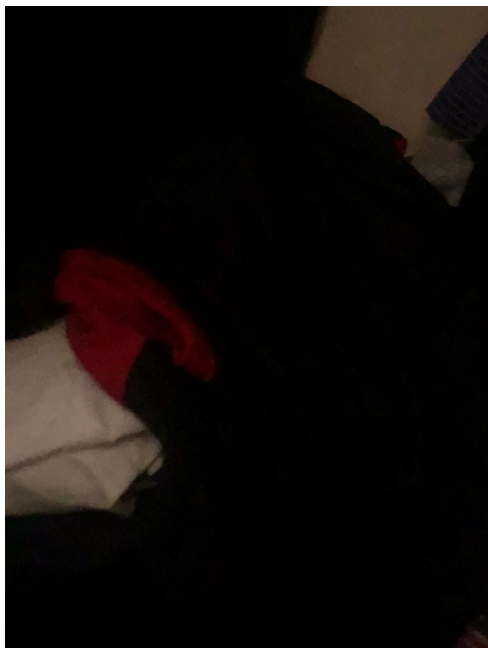

I expected this panorama to get stitched on the label of the bottle but instead it preferred to stitch from the tables instead. This was to be unexpected, maybe the sift features of the table are more prominent than the O and OFT part of the labels.

No panorama output as the sift wasn't able to detect any descriptors. As expected as the features in both these images are very faint and merges with the background, nothing sticks out as such.

I expected the panorama to be messed up and funky but due to the high resolution picture of the tubelight it was able to proceed as normal. If the brightness was intense the expected panorama would've been like a weird artifact glitching out.

Again what was to be expected was a blurry and warped panorama due to low light and bad descriptors from the sift. But again due to the high resolution of the camera it was able to pick up the descriptors properly.
